The code and designs can be then exported to file and integrated with other projects. You're probably familiar with Verilog, if not, you can refer to this YouTube video for a basic introduction. JavaScript offers a variety of functionality, including "arrays" and "numbers". But if you still haven't encountered map and reduce functions, then these are the basic concepts to wrap your head around. Mapping The map function takes a list of data and applies a function to each item in order to produce a list of results. The following is an example of map; it returns an array of constants: `const numbers = [1, 2, 3, 4, 5] function addThree(n) { return n + 3; } const addThreeNumbers = numbers.map(addThree); addThreeNumbers // [4, 5, 7]` Reducing The reduce function takes a list of results from the original data and returns a single value in its entirety. The following is an example of reduce; it returns the sum of all the numbers: `const addThreeNumbers = numbers.reduce((a, n) => a + n, 0); addThreeNumbers // 15`

JavaScript offers a variety of built-in functions which are perfect for many applications. Converting JavaScript data types The following is an example of converting a JavaScript number into an integer. To do so, the number is rounded towards zero. `const numbers = [1, 2, 3, 4, 5]; const integers = numbers.map(i => parseInt(i, 10)); const roundedIntegers = integers.map(i => i % 1 == 0 ? i : 0); roundedIntegers // [1, 2, 3, 4, 5]` Converting JavaScript data types The following is an example of converting a JavaScript object into a `b7e8fdf5c8`
